

ABSTRACT

To retain the virginity of cylindrical articles packed in a cylindrical article package, the present invention provides a package of a novel structure and a fabrication method for the same. More specifically, the present specification discloses a package wherein a film has a slit at least either one of an upper end face and a lower end face of the package in a portion thereof corresponding to a boundary between the adjacent cylindrical articles, and more specifically, a package wherein the film has a slit along the boundary between the adjacent cylindrical articles, and is curved in such a manner as to conform to the outer circumferential surfaces of the cylindrical articles located adjacent to the boundary.
